

NITER INNOVATE HACKATHON 2026

“Be The Solution”

Official Problem Statement

Background

Every day, faculty members and students at NITER (National Institute of Textile Engineering and Research) face small and big problems in campus life. Some of these problems slow down academic work. Some make daily life harder. Some are simply never solved because no one has built the right tool yet.

NITER Innovate Hackathon 2026 invites students to look closely at these everyday campus problems and build a real, working software solution (SaaS) for one of them. As NITER is closely tied to Bangladesh's Ready-Made Garments (RMG) industry through its textile engineering programs, students are also encouraged to tackle real, industry-facing problems from the RMG/textile sector as an additional track.

The Problem

Campus life at NITER has recurring pain points across several areas, and the RMG industry that NITER closely serves has its own set of unsolved digital gaps, including but not limited to the following:

Area	Example Pain Points
Student Welfare	No easy way to raise or track personal/hostel issues, lack of a central support system
Health	Difficulty booking medical center appointments, no digital health record, slow emergency response
Transport	Uncertain bus schedules, no live tracking, seat/route confusion
Academic	Manual class routines, scattered notices, no unified academic dashboard
Logistics	Manual event registration, payment tracking, and resource booking
RMG Industry (Textile & Apparel)	No unified production-floor tracking, manual quality control/compliance documentation, poor worker safety & grievance reporting systems, fabric/inventory wastage not tracked digitally, buyer order & shipment status hard to monitor, no digital ETP/energy monitoring

These problems are known, but no unified digital solution currently exists to solve them at NITER or, in the case of the RMG track, in the industry NITER's graduates go on to serve.

The Challenge

Participants must design and build a Software-as-a-Service (SaaS) solution that solves at least one of the problem areas above (or a closely related campus or RMG-industry problem, with justification).

The solution should be:

- Usable by real students, faculty, or industry stakeholders — not just the concept.
- Practical, solving a real problem instead of an imagined one.
- Scalable, built in a way that could actually be deployed at NITER or within an RMG factory/organization.

Expected Deliverables

- A working prototype (web or mobile) demonstrating the core solution.
- A short presentation (problem, solution, tech stack, impact).
- Source code repository (GitHub or equivalent).

Judging Criteria

Criteria	Weight	What Judges Will Look For
Problem Relevance	20%	How real and important is the problem for NITER's campus life or the RMG industry?
Innovation & Creativity	15%	Is the approach original and thoughtful, not just a copy of existing tools?
Technical Execution	15%	Does the prototype actually work? Is the code quality solid?
Usability & Design	10%	Is it easy to use and understand for students/faculty/industry users?
Impact & Scalability	35%	Could this realistically be used and scaled at NITER or in an RMG setting?
Presentation	5%	Is the idea communicated clearly and confidently?
Total	100%	

A Note to Participants

You don't need to solve everything. Pick one real problem — whether from campus life or the RMG industry — understand it deeply, and build something that genuinely helps. A small tool that actually works is worth more than a big idea that doesn't.

What You Need to Submit

Project Name

Problem & Solution

- Your Problem Statement — what problem you are trying to solve
- Your Solution — describe your solution approach
- Tech Stack You Used — list the technologies, frameworks, and tools you used

- Future Impact — describe the potential future impact of your project

Links

- GitHub Repo Link (if your repo is private, add mdhabibullahmahmudncs13@gmail.com as a collaborator)
- Video Link — link to a demo video of your project
- Live Link — only if you have deployed your application
- Documentation Link — must include system architecture documentation

Good Luck!

NITER Computer Club (NCC)
